Bee, Wasp and Hornet Collectors

Stinging insects such as wasps and hornets often build their nests near occupied buildings. They may become a nuisance or a danger to those allergic to their sting. They are social insects, with many living in the same nest. Most wasps and hornets do not fly at night. If possible, wait until frost to remove the nest. The queen leaves the nest in the fall and hibernates either underground or in unused buildings until spring. Use screens in buildings to block them from migrating indoors. If nests are in an attic or other enclosed space, close the ventilators and use no-pest strips in the vicinity.

Honey bees must be professionally removed. They are beneficial and should not be killed. If the nests are not cleaned out, the honey will become rancid, stain walls and attract vermin.

The following charts have been prepared at the request of those listed, as a convenience to those who need assistance with wasp, hornet, and bee problems. These beekeepers will collect honeybees; some will exterminate wasps, hornets and yellow jackets. There may be a charge for mileage, exterminations and time for collecting the colonies. Additionally, many of the beekeepers on the list also remove hives.

- TO REMOVE THE NEST YOURSELF**
1. Purchase a pressurized can of wasp and hornet spray.
 2. Read the label carefully and follow directions.
 3. Use any protective clothing mentioned on the label directions.
 4. When it is totally dark outside, spray the chemical into the nest. The insects are inactive when it is dark so they won't swarm out.
 5. Take notice the following day to see if there is any activity around the nest. If there is, repeat steps 2, 3 and 4 as many times as necessary.
 6. If there is no activity, remove the nest the next evening. Crush it and either bury it 12" underground or place it in a plastic bag and tie it up.
